## 85 external links are broken

85 <sup>0</sup>

About this issue: Broken external links lead users from one website to another and bring them to non-existent webpages. Multiple broken links negatively affect user experience and may worsen your search engine rankings because crawlers may think that your website is poorly maintained or coded. Please note that SEMrushBot may detect a working link as broken. Generally, this happens if the server hosting the website you're referring to blocks our crawler from accessing this website. How to fix: Please follow all links reported as broken. If a target webpage returns an error, remove the link leading to the error page or replace it with another resource. If the links reported as broken do work when accessed with a browser, you should contact the website's owner and inform them about the issue.

---

## 15 internal links are broken

15 <sup>0</sup>

About this issue: Broken internal links can cause a webpage to return an error status. This can occur due to an incorrect or malformed URL, or because the page the link is leading to is broken or no longer exists, etc. Multiple broken internal links may discourage users from visiting other pages of your website. Also, broken links prevent crawlers from indexing your site properly. As a result, your website rank may be downgraded. Please note that SEMrushBot may detect a working link as broken if your website blocks our crawler from accessing it. This may happen due to the following reasons: 1. DDoS protection system. 2. Overloaded or misconfigured server. 3. "Disallow" entries in your robots.txt. How to fix: Please follow all the links reported as broken. If a webpage returns an error, remove the link leading to the error page or replace it with another resource. If the links reported as broken do work when accessed with a browser, you may try either of the following: 1. Contact your web hosting support team. 2. Instruct search engine robots not to crawl your website too frequently by specifying the "crawl-delay" directive in your robots.txt.

---

## 14 pages have duplicate meta descriptions

14 <sup>0</sup>

About this issue: SEMrushBot reports pages that have duplicate meta descriptions only if they are exact matches. A <meta description> tag is a short summary of a webpage's content that helps search engines understand what the page is about and can be shown to users in search results. Duplicate meta descriptions on different pages mean a lost opportunity to use more relevant keywords. Also, duplicate meta descriptions make it difficult for search engines and users to differentiate between different webpages. It is better to have no meta description at all than to have a duplicate one. How to fix: Provide a unique, relevant meta description for each of your webpages.

---

## 8 issues with duplicate title tags

8 <sup>0</sup>

About this issue: SEMrushBot reports pages that have duplicate title tags only if they are exact matches. Duplicate <title> tags make it difficult for search engines to determine which of a website's pages is relevant for a specific search query, and which one should be prioritized in search results. Pages with duplicate titles have a lower chance of ranking well and are at risk of being banned. Moreover, identical <title> tags confuse users as to which webpage they should follow. How to fix: Provide a unique and concise title for each of your pages that contains your most important keywords.

---

## 4 sitemap.xml files have format errors

4 <sup>0</sup>

About this issue: If your sitemap.xml file has any errors, search engines will not be able to process the data it contains, and they will ignore it. How to fix: Review your sitemap.xml file and fix all errors.

---

#### 4 pages returned 4XX status codes

4 

About this issue: A 4xx error means that a webpage cannot be accessed. This is usually the result of broken links. These errors prevent users and search engine robots from accessing your webpages, and can negatively affect both user experience and search engine crawlability. This will in turn lead to a drop in traffic driven to your website. Please be aware that SEMrushBot may detect a working link as broken if your website blocks our crawler from accessing it. This usually happens due to the following reasons: 1. DDoS protection system. 2. Overloaded or misconfigured server. 3. "Disallow" entries in your robots.txt. How to fix: Please follow all links reported as 4xx. If a webpage returns an error, remove the link leading to the error page or replace it with another resource. If the links reported as 4xx do work when accessed with a browser, you can try either of the following: 1. Contact your web hosting support team. 2. Instruct search engine robots not to crawl your website too frequently by specifying the "crawl-delay" directive in your robots.txt

#### 1 internal image is broken

1 

About this issue: An internal broken image is an image that can't be displayed because it no longer exists, its URL is misspelled, or because the file path is not valid. Broken images may jeopardize your search rankings because they provide a poor user experience and signal to search engines that your page is low quality. How to fix: Replace all broken images or delete them.

#### 1 page couldn't be crawled

1 

About this issue: This issue indicates that SEMrushBot couldn't access the webpage because the server either timed out or refused/closed the connection before our crawler could receive a response. How to fix: Please contact your web hosting technical support team and ask them to fix the issue.

#### 0 issues with incorrect hreflang links

0 

#### 0 hreflang conflicts within page source code

0 pages have duplicate content issues	0
0 pages don't have title tags	0
0 pages returned 5XX status codes	0

WARNINGS

1181 0

**727 images don't have alt attributes**

727 0

About this issue: Alt attributes within <img> tags are used by search engines to understand the contents of your images. If you neglect alt attributes, you may miss the chance to get a better placement in search results because alt attributes allow you to rank in image search results. Not using alt attributes also negatively affects the experience of visually impaired users and those who have disabled images in their browsers. How to fix: Specify a relevant alternative attribute inside an <img> tag for each image on your website, e.g., "".

**119 pages have no hreflang and lang attributes**

119 0

About this issue: This issue is reported if your page has neither lang nor hreflang attribute. When running a multilingual website, you should make sure that you're doing it correctly. First, you should use a hreflang attribute to indicate to Google which pages should be shown to visitors based on their location. That way, you can rest assured that your users will always land on the correct language version of your website. You should also declare a language for your webpage's content (i.e., lang attribute). Otherwise, your web text might not be recognized by search engines. It also may not appear in search results, or may be displayed incorrectly. How to fix: Perform the following: 1. Add a lang attribute to the <html> tag, e.g., "<html lang="en">". 2. Add a hreflang attribute to your page's <head> tag, e.g., <link rel="alternate" href="http://example.com/" hreflang="en"/>

**115 pages don't have an h1 heading**

115 0

About this issue: While less important than <title> tags, h1 headings still help define your page's topic for search engines and users. If an <h1> tag is empty or missing, search engines may place your page lower than they would otherwise. Besides, a lack of an <h1> tag breaks your page's heading hierarchy, which is not SEO friendly. How to fix: Provide a concise, relevant h1 heading for each of your page.

**86 pages have low text-HTML ratio**

86 0

About this issue: Your text to HTML ratio indicates the amount of actual text you have on your webpage compared to the amount of code. This warning is triggered when your text to HTML is 10% or less. Search engines have begun focusing on pages that contain more content. That's why a higher text to HTML ratio means your page has a better chance of getting a good position in search results. Less code increases your page's load speed and also helps your rankings. It also helps search engine robots crawl your website faster. How to fix: Split your webpage's text content and code into separate files and compare their size. If the size of your code file exceeds the size of the text file, review your page's HTML code and consider optimizing its structure and removing embedded scripts and styles.

**69 pages have a low word count**

69 0

About this issue: This issue is triggered if the number of words on your webpage is less than 200. The amount of text placed on your webpage is a quality signal to search engines. Search engines prefer to provide as much information to users as possible, so pages with longer content tend to be placed higher in search results, as opposed to those with lower word counts. How to fix: Improve your on-page content and be sure to include more than 200 meaningful words.

### 54 pages have slow load speed

54 0

About this issue: Page load speed is one of the most important ranking factors. The quicker your page loads, the higher the rankings it can receive. Moreover, fast-loading pages positively affect user experience and may increase your conversion rates. Please note that "page load speed" usually refers to the amount of time it takes for a webpage to be fully rendered by a browser. However, SEMrushBot only measures the time it takes to load a webpage's HTML code - load times for images, JavaScript and CSS are not factored in. How to fix: The main factors that negatively affect your HTML page generation time are your server's performance and the density of your webpage's HTML code. So, try to clean up your webpage's HTML code. If the problem is with your web server, you should think about moving to a better hosting service with more resources.

### 7 pages have too much text within the title tags

7 0

About this issue: Most search engines truncate titles containing more than 75 characters. Incomplete and shortened titles look unappealing to users and won't entice them to click on your page. How to fix: Try to rewrite your page titles to be 75 characters or less.

### 2 pages have temporary redirects

2 0

About this issue: Temporary redirects (i.e., a 302 and a 307 redirect) mean that a page has been temporarily moved to a new location. Search engines will continue to index the redirected page, and no link juice or traffic is passed to the new page, which is why temporary redirects can damage your search rankings if used by mistake. How to fix: Review all pages to make sure the use of 302 and 307 redirects is justified. If so, don't forget to remove them when they are no longer needed. However, if you permanently move any page, replace a 302/307 redirect with a 301/308 one.

### Homepage does not use HTTPS encryption

1 0

About this issue: Google considers a website's security as a ranking factor. Websites that do not support HTTPS connections may be less prominent in Google's search results, while HTTPS-protected sites will rank higher with its search algorithms. How to fix: Switch your site to HTTPS.

### 1 page doesn't have enough text within the title tags

1 0

About this issue: Generally, using short titles on webpages is a recommended practice. However, keep in mind that titles containing 10 characters or less do not provide enough information about what your webpage is about and limit your page's potential to show up in search results for different keywords. How to fix: Add more descriptive text inside your page's <title> tag.

### Sitemap.xml not found

0 0

### Sitemap.xml not indicated in robots.txt

0 0

### 0 internal links contain nofollow attributes
